

VIII. Mini Project-Airline Flight Analytics

AIM:

To clean, process, and visualize airline flight datasets using Python, and build both static (Matplotlib) and interactive (Plotly) visualizations to identify flight trends, airline performance, delays, cancellations, and route patterns.

DOMAIN:

Airline Analytics / Aviation Data Analytics

PROBLEM STATEMENT:

Airline operations generate large amounts of data related to flights, airlines, airports, delays, cancellations, routes, and travel times. Analyzing this data manually makes it difficult to identify operational patterns and performance trends.

There is a need for an interactive data visualization system that can analyze flight operations, compare airlines, identify delay and cancellation patterns, and present meaningful insights through an easy-to-understand dashboard.

OUTPUT:

Python:

PowerBI:

Tableau:

RESULT:

Thus, the given program was written and executed successfully.
